**LATEST ADVANCES IN PERSONAL BIODIESEL MAKERS OFFER SAFETY
AND EASE AND AFFORDABLE FUEL**

New Fuelpods use automation, air operated controls, and a carbon steel frame to dramatically improve safety for home processors. With the latest advances, making fuel has entered the realm of dishwashing and clothes washing.

SPARKS, NV – Consumers looking to fight the high price of diesel fuel, protect the environment, or who are fed up with our country's growing dependence on foreign oil sources now have the most advanced technology at their disposal. The innovative Fuelpod from Green Fuels America provides reliable, eco-friendly biodiesel fuel that can be pumped right into a car or truck without any conversion. In fact diesel engines run smoother and cleaner on biodiesel. But the biggest reason to switch – homeowners can make their own fuel for less than a dollar a gallon.

Why BioDiesel?

With fuel costs on the rise, a growing number of Americans are quickly realizing that biodiesel represents an economical and superior form of diesel fuel. With the Fuelpod, commercial quality biodiesel fuel can be produced for as little as \$.70 a gallon for a potential savings of thousands of dollars each year. Once produced, it can be safely used to replace petroleum-based fuel used in diesel vehicle engines without any modifications, as well as in most home oil furnaces. Nearly 30 percent of Americans, including 80 percent of consumers in the Northeast, heat their homes with an oil furnace that can easily and inexpensively be adjusted to work on biodiesel fuel. AND every gallon of biodiesel that goes into a truck saves not only money, but 8 pounds of carbon pollutants!

Page Two

The use of biodiesel fuel also reduces vehicle emissions of sulfur oxides, particulates and carbon monoxide by 70 percent. Additionally, biodiesel is non-toxic, biodegradable and less combustible which makes it easier to store and transport.

The Safer, Faster, Easier FuelMeister II

Despite the many advantages of processing personal biodiesel fuel, it's important to realize that not all systems perform safely and reliably. Unfortunately, the biodiesel market has, in recent years, become overcrowded with many garage-based operators. Some system designs even utilize old hot water heaters as the main processing unit—a design that has proven unsafe, unreliable and produces inconsistent results.

However, Green Fuels, a global commercial leader in biodiesel production, saw an opportunity to take its industrial technology and put it into a small 24 inch wide by 60 inch tall micro-processor for personal use. **With advanced air operated automation making fuel has finally entered the realm of the dishwasher and the washing machine.** Operators simply collect used oil from area restaurants or purchase for a small fee from the commercial grease haulers, pour the liquid into the processor, add the required amount of catalyst and methanol to convert the oil and walk away while the Fuelpod does the work.

Beyond the Fuelpod's unique product benefits, users can also be assured that the product will consistently produce a high-quality biodiesel fuel thanks to Fuelpod's national technical support team. The system, which retails for approximately \$4,995, comes complete with all of the chemical testing equipment, scales and safety equipment needed, waterless purifier, oil pre-heater, fueling station, as well as a detailed operator's manual and DVD that lead customers, step-by-step, through the process. Additionally, Fuelpod offers a toll-free support line (866-996-6130).

About Green Fuels America

Green Fuels America is a wholly owned subsidiary of Green Fuels, UK. Green Fuels UK is the leading global supplier of biodiesel equipment and a center for development of specialized biodiesel applications. Green Fuels UK was the first to supply biodiesel for commercial trains and Formula 3 racing cars and works in biodiesel development projects with leading manufacturers around the world, including Fuchs, Land Rover and Jaguar. The company has established itself as the biodiesel leader in a rapidly growing segment of the renewable energy sector -- production of biofuels from forms of feedstock which do not disrupt the food supply chain.
